

Step-level rogue detection on the StepShield holdout (216 trajectories: 108 rogue / 108 clean)

Certified points: thresholds from calibration-fold cleans only (conformal order statistics), pair-level 4-fold CV; realized pooled out-of-fold rates shown.
 Caveat: fine-tuned points (blue) benefit from the benchmark's train→holdout template reuse; published baselines (gray squares) are untrained.
 Wilson-95 intervals for the primary point are drawn in Fig. 2; its recall CI [84.9, 95.6] contains LLMJudge's 95.4 point estimate.
